

Frontend Project

Today, you will be creating a web application called LearnStart. LearnStart is a place for startup people to learn about stories of other successful startups.

Your goal is to recreate LearnStart in a way that's as close to the mockup as possible, utilizing grid layouts and responsiveness. You can use any front-end library you want.

Details

Header

- Header is floating for both desktop and mobile.
- Clicking on **Sign up** will bring up the **Sign up modal**.

Home

- Clicking on **Read Now** button will take the user to the **Stories** page.
- Hero should take up the entire screen.

Sign up modal

- Sign up modal is center positioned above a translucent backdrop on desktop and takes up the entire screen on mobile.
- There is no need for hooking up backend to this.
- Perform HTML5 form validation check upon clicking the **Continue** button. Light up fields that do not pass.
- Clicking on **X** will close the modal.

Stories

- Create a re-usable “product card” for each story item.
- Note that on mobile the user can swipe left and right to see more stories under the same section.

Style guide

- Re-create our style guide in CSS to help create the pages.

What we are looking for

- As pixel-perfect as possible. Fill in the gaps where necessary.
- Clear, logical, dry code, down to every little detail.
